Given the following binary tree and InOrder algorithm determine the traversal order

Inorder(binTree:BinaryTree): void
        If(binTree is not empty)
                Inorder(left subtree of binTree's root)
                Visit the root of binTree
                Inorder(right subtree of binTree's root)
